The several varieties of coal vary in their composition, hence the term does not admit of precise scientific definition, but they generally agree in containing a much larger proportion of carbon than of the other elements, which are chiefly oxygen and hydrogen, and frequently a small portion of nitrogen. Coal is the most valuable of all the minerals from which Britain derives her prosperity, and may be regarded as the main support of the whole system of her industrial production. It fuses the metals, produces the steam which sets the machinery in motion, and, in short, may be said to render all the resources of this country available for use.—*To call* or *haul over the coals,* to call to a strict or severe account; to reprimand.—*To carry coals,* to submit to insult. *Shak.* See under CARRY.—*To carry coals to Newcastle,* to perform unnecessary labour.—*To blow a coal,* to kindle strife.

It is a native of Arabia and Abyssinia; but is now extensively cultivated throughout tropical countries. It will grow to the height of 16 or 18 feet, but it is seldom permitted to exceed 8 or 9 feet, for the convenience of gathering the fruit. The stem is upright, and covered with a light brown bark; the branches are horizontal and opposite. The flowers grow in clusters at the bases of the leaves, are pure white, and of an agreeable odour. The fruit is a small red fleshy berry, having the size and appearance of a small cherry. Each berry contains two seeds, commonly called coffee-beans or coffee-nibs. When ripe the berries are gathered, and the outer pulp and the parchment-like covering of the seeds are removed. The best coffee is said to be the Mocha coffee from Arabia Felix.—2. A drink made from the seeds of the coffee-tree, by infusion or decoction, the former method being said to be that which produces by far the best beverage, as the flavour is spoiled by boiling. Before being used the seeds are roasted, and then ground in a coffee-mill, or, as in the East, pounded. The beverage is improved by being made with beans freshly roasted and ground. Coffee acts as a slight stimulant, and thus promotes cheerfulness and removes languor, it also aids digestion; but in some constitutions it induces sleeplessness and nervous tremblings. The use of coffee is said to have been made known in Europe by Leonhard Rauwolf, a German physician, whose travels appeared in 1582. It was introduced into England by a merchant named Edwards, whose Greek servant Pasqua opened a coffee-house in London in 1652.

The *coffee-houses* were the chief organs through which the public opinion of the metropolis vented itself. . . . Every man of the upper or middle class went daily to his *coffee-house* to learn the news and discuss it. Cohesion (kō-hē′zhon), *n.* [From L. *cohæreo, cohæsi, cohæsum*, to cohere. See COHERE.] 1. The act or state of cohering, uniting, or sticking together; in *physics*, the state in which, or the force by which, the particles of the same material are kept in contact so as to form a continuous mass. This force acts at insensible distances, or when the particles of matter which it unites are placed in contact, and is thus distinguished from the *attraction of gravitation*, which acts at any distance. It unites particles into a single mass, and that without producing any change of properties, and is thus distinguished from *adhesion*, which takes place between different masses or substances, as between fluids and solids; and from *chemical attraction* or *affinity*, which unites particles of different kinds together, and produces a new substance. The power of cohesion in different bodies is estimated by the force necessary to pull them asunder. In general, cohesion is most powerful among the particles of solid bodies, weaker among those of fluids, and least of all, or almost entirely wanting, in elastic fluids, as air and gases. Hardness, softness, tenacity, elasticity, malleability, and ductility are to be considered as modifications of cohesion. The great antagonist of cohesion is heat.—*Magnetic cohesion*, that power by which two magnetic bodies adhere together, as iron to a piece of loadstone.—*Cohesion figures*, a class of figures produced by the attraction of liquids for other liquids or solids with which they are in contact, and divided into *surface, submersion, breath*, and *electric cohesion figures.* It was found by Tomlinson that a drop of an independent liquid, as oil or alcohol, spread itself out on the surface of water always in a definite figure, but differing with each fluid dropped on the water, and he suggested that this might be employed as a test for oils, &c. The same principle holds with liquids which, from greater specific gravity, sink slowly to the bottom, each liquid submerged forming a specific figure peculiar to itself. *Breath figures* are produced by putting a drop of the liquid to be examined on a slip of mica and breathing on it, when again each fluid takes a distinct characteristic shape. *Electric cohesion figures* are produced by electrifying drops of various liquids placed on a plate of glass.—2. Connection; dependence; affinity; coherence. 'Ideas that have no natural *cohesion.*' *Locke.* [Now rare in this sense.]

When the fluid solution is applied to the cut or wound it immediately dries into a semi-transparent, tenacious film, which adheres firmly to the part, and under it the wound or abrasion heals without inflammation. In a slightly modified form collodion is also employed as the basis of a photographic process, called the *collodion process.* To obtain a negative picture by the collodion process a glass plate is covered with a film of collodion, which is sensitized by a salt (usually the nitrate) of silver, and the plate exposed in the camera. The picture obtained is then developed by the application of a solution of protosulphate of iron, water, glacial acetic acid, and alcohol, and fixed by a solution of hyposulphite of soda or of cyanide of potassium. To obtain a positive picture the negative is laid upon a sheet of paper placed in a glass frame, the paper having been sensitized by immersion in a solution of common sea-salt, and afterwards in one of nitrate of silver. The exposure is continued till the tone is sufficiently deep, after which the tint is improved by means of a salt of gold, and the picture fixed by hyposulphite of soda. Positive pictures may be obtained direct by the collodion process, but the above is the method most frequently adopted.

Colour (kul'ėr), *n.* [L. *color*, colour.] 1. That in respect of which bodies have a different appearance to the eye independently of their form. It is a property or attribute of light rather than of bodies themselves, though the molecular constitution of a body, by determining the character and number of the light vibrations it returns to the eye, determines its colour. In perfect darkness bodies have no colour. The principal colours are red, orange, yellow, green, blue, indigo, and violet; but they all admit of almost endless gradations of shade. These are sometimes called the primary colours, being the colours into which white light is divided by a glass prism, but in a stricter sense the primary colours are three in number, namely, red, green, and violet (or blue). These three colours or kinds of light cannot be resolved into any others, while a yellow ray for instance can be resolved into red and green, or can be produced by the mingling of red and green light, consequently yellow is not now regarded as a primary colour by scientific men. Inasmuch, however, as a yellow and a blue pigment will always produce a green when mixed, red, yellow, and blue may still in a sense be regarded as primary. In the scientific sense of the word white and black are not considered colours, a white body reflecting and a black body absorbing all the rays of light without separating them, whereas the colours proper are due to separation of the rays of light by partial absorption and reflection, or by refraction.—2. (*b*) Inability to distinguish the nicer shades of the more composite colours, as browns, grays, and neutral tints. (*c*) Inability to distinguish between the primary colours, red, blue, and yellow, or between them and their secondaries, green, purple, orange, and brown. Red is the colour which the colour-blind are most commonly unable to distinguish, while yellow is the most easily recognized. Colour-blindness occurs in eyes whose power of vision, as to form and distance, is quite perfect. This defect is common especially among men. Of 1154 persons examined in Edinburgh, 65, or 1 in 17·7, were found colour-blind. Called also *Daltonism*.

View of Donati's Comet.—Illustrated London News.

The former, after being visible from the earth for a shorter or longer time, disappear into space apparently never to return; the latter return to us periodically. Some comets are only visible by the aid of the telescope, while others can be seen by the naked eye. In the latter case they usually appear like stars accompanied with a train of light, sometimes short and sometimes extending over half the sky, mostly single and more or less curved, but sometimes forked. In a comet which appeared in 1744 the train was divided into several branches, spreading out from the head like the blades of an open fan. The train is not stationary relatively to the head, but is subject to remarkable movements. The direction in which it points is always opposite to the sun, and as the comet passes its perihelion the train changes its apparent position with extraordinary velocity. The head of the comet is itself of different degrees of luminosity, there being usually a central core, called the *nucleus*, of greater brilliancy than the surrounding envelope, called the *coma*. The paths in which comets move are not, like those of the planets, all nearly in the same plane as the orbit of the earth, but are inclined to that orbit at all angles; and the motion of the comets along their paths is sometimes direct, that is, in the same direction as that of the earth and the other planets, sometimes retrograde. The matter of which comets is composed is so transparent that the faintest stars are seen through them without the slightest diminution of their lustre, and in one instance at least was shown to be of extreme tenuity. This was in the case of the comet of 1779, which became entangled among the satellites of Jupiter and yet exerted no disturbing influence on their course. The most remarkable discovery of recent times regarding comets is the identity of the course of some of them with the orbit of certain showers of shooting-stars. This was first demonstrated by the Italian astronomer Schiaparelli, who proved the agreement between the orbit of the great comet of 1862 and that of the star-shower seen annually about August 9, 10. It is, however, denied that the comets themselves can be identified with the star-showers, as the two phenomena are seen in different parts of the orbit, and Zöllner has suggested that comets may be the fluid portions and star-showers the solid fragments of a larger celestial body. One of the most remarkable comets of recent years was that known as Donati's, discovered by Dr. Donati of Florence in 1858. It was very brilliant in England in the autumn of that year, and on the 18th of October was near coming into collision with Venus. —*Comet wine*, wine made in any of the years in which comets have been seen, and supposed in consequence to have a superior flavour.

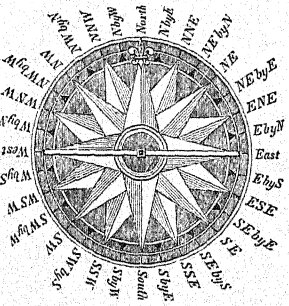
It consists of that body of rules, principles, and customs which have been received from our ancestors, and by which courts have been guided in their judicial decisions. The evidence of this law is to be found in the reports of those decisions and the records of the courts. Some of these rules may have originated in edicts or statutes which are now lost, or in the terms and conditions of particular grants or charters; but it is quite certain that many of them originated in judicial decisions founded on natural justice and equity, or on local customs. Wherever statute law, however, runs counter to common law, the latter is entirely overruled; but common law, on the other hand, asserts its pre-eminence where equity is opposed to it. By the Judicature Act, 1873, all branches of the Supreme Court of Judicature are to administer law and equity concurrently.—*Common measure.* See above, *Common Divisor.*—*Common pasturage,* in *Scots law,* a known rural servitude by which the owner of the dominant tenement is entitled to pasture a certain number of cattle on the grass grounds of the servient tenement.—*Common Pleas,* formerly one of the three superior courts of common law in England, presided over by a lord chief-justice and five (at an earlier period four) puisné judges, and having cognizance of all civil causes, real, personal, or mixed, as well by original writ as by removal from the inferior courts. In other states the jurisdiction is limited to a county.—*Common Prayer,* the liturgy or public form of prayer prescribed by the Church of England to be used in all churches and chapels, and which the clergy are to use under a certain penalty. 4. An instrument used to indicate the magnetic meridian or the position of objects with respect to that meridian. The mariner's or ship compass consists of three parts: namely, the box, the card or fly, and the needle. The box, which contains the card and needle, is a circular brass receptacle, hung within a wooden one by two concentric rings called gimbals, so fixed by the cross-centres to the box that the inner one, or compass-box, shall retain an horizontal position in all motions of the ship. The circular card is divided into thirty-two equal parts by lines drawn from the centre to the circumference, called points or rhumbs; the intervals between the points are also divided into halves and quarters; and the whole circumference into equal parts or degrees, 360 of which complete the circle; and, consequently, the distance or angle comprehended between any two rhumbs is equal to 11¼°. The four principal are called cardinal points: viz. North, South, East, and



Compass Face or Card.

West. The names of the rest are compounded of these. The needle is a small bar of magnetized steel. It is fixed in the under side of the card, and in the centre is placed a conical socket, which is poised on an upright pointed pin fixed in the bottom of the box; so that the card, hanging on the pin, turns freely round its centre; and one of the points, by the property of the needle, will always be directed towards the north pole. The needle, however, is liable to a certain deviation owing to the magnetism of the ship itself, and this is especially strong in iron ships. (See *Deviation of the compass*, under DEVIATION.) To obviate this defect Sir W. Thomson has invented a compass having a number of needles arranged in a particular manner instead of one. In the compass used by land-surveyors and others the needle is not fixed to the card, but plays alone, the card being drawn on the bottom of the box.—The *azimuth compass* differs in some respects from the foregoing. See AZIMUTH.—*Hanging compass*, a mariner's compass suspended with its face downwards to the roof of a cabin or to a pole on deck. In the former position it is sometimes called a *Tell-tale*, because it shows to one below if the proper course of the ship is maintained by the steersman.—5. A mathematical instrument for describing circles, measuring figures, distances between two points, &c.: often with the plural designation *compasses*, or a *pair of compasses*.

In his hand
He took the golden *compasses*, prepared
In God's eternal store, to circumscribe
The universe and all created things. *Milton.*

—*Common compasses*, or *dividers*, consist simply of two pointed legs, movable on a joint or pivot, and used for measuring and transferring distances. For describing circles the lower end of one of the legs is removed, and its place supplied by a holder for a pencil or pen.—*Hair compasses*, compasses having a spring attached to the upper part of the inside of one of the legs, and pressing outwards against the lower part of the other, thus constantly tending to keep the legs apart. By means of a finely-threaded screw the spring can be compressed or relaxed with the utmost nicety, and the distance of the legs regulated to a hair's-breadth.—*Bow compasses*, the name given to several instruments for measuring distances, describing arcs, &c., having the two legs united at top by a bow or spring so as to tend to move apart, the distance between the legs being adjusted by means of a screw and nut. For larger varieties see BOW-COMPASS.—*Triangular compasses*. See TRIANGULAR.—*Proportional compasses*. See PROPORTIONAL.

It is excessively poisonous, appearing to cause death by inducing paralysis of the muscles used in respiration. Called also *Coniine*.

Conic (kon'ik), *a.* [L. *conicus*; Gr. *kōnikos*. See CONE.] 1. Having the form of a cone; round and tapering to a point; conical. [Now poetical.]

2. Pertaining to a cone; as, *conic* sections. —*Conic sections* are the figures formed by the cutting of a cone by a plane; they are five in number, corresponding to the different positions of the cutting plane with respect to the cone. When the cutting plane passes through the apex of the cone, and coincides with the axis, or passes through the apex and any part of the base, the section is a triangle, as in fig. 1. When the plane cuts the axis of a right circular cone at right angles, the section is a circle, as in fig. 2. When the plane cuts the axis obliquely, and passes through both sides of the cone, the section is an ellipse or oval, as in fig. 3. When the plane cuts the axis in a line parallel to one side of the cone, the section is a parabola, as in fig. 4. And lastly, if the section be made parallel to the axis, or so as to make a greater angle with the base than that which it makes with the side of the cone, it will be an hyperbola, as in fig. 5. The term conic sections is applied more peculiarly to the last three figures, and the doctrines of their several properties constitute one principal branch of geometry, of great importance in physical and geometrical astronomy, as well as in the physico-mathematical sciences. Algebraically considered, the conic sections are curves of the second degree, and may be treated as generated by the motion of a point on a plane. Their different properties may be investigated by the modern algebraic analysis, as well as by geometry.

(*c*) *Taxineæ*, with solitary nut-like or drupe-like seeds, like the yew, gingko, &c. Many of the trees supply valuable timber, and some of them edible seeds. The spores are simple or articulated, solitary or chained together, and sometimes fasciculate, naked or inclosed in a distinct cyst. 2. In *gram.* to inflect (a verb) through its several voices, moods, tenses, numbers, and persons, or so many of them. The name has its origin in the fact that in inflected languages a verb is conjugated by *conjoining* certain inflectional syllables with the root.

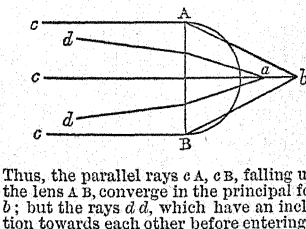
In the ellipse the *conjugate diameter* bisects the transverse diameter at right angles.—*Conjugate hyperbolas,* also called *adjacent hyperbolas,* are such as have the same axes, but in the contrary order, the first or principal axis of the one being the second axis of the other, and the second axis of the former being the first axis of the latter.—*Conjugate point of a curve,* a single point lying by itself, whose co-ordinates satisfy the equation of the curve, without its actually being on any continuous branch of the curve.—*Conjugate foci,* in *optics.* (*a*) When rays, falling upon a lens, are so refracted as to converge and meet in a point, either nearer the lens than the principal focus or farther from it, the point in which they meet, and the principal focus, are called, with respect to each other, *conjugate foci.*



Thus, the parallel rays *c* A, *c* B, falling upon the lens A B, converge in the principal focus *b*; but the rays *d d,* which have an inclination towards each other before entering the lens, converge at *a*; therefore *a* and *b* are *conjugate foci* in the case illustrated. In *biol.* a union of two distinct cells in order to reproduction, as in the Confervaceæ and Diatomaceæ. Thus, two filaments of Zygnema and some analogous genera are seen to unite by means of tubes projected from each, and the contents of one cell are poured into the other, called a mother cell, the result of which is a germinating spore. The same process takes place in the case of some of the lower animals, as the Diplozoön.

The planets, relatively to the earth, are separated into two divisions, inferior and superior, the former having their orbits within and the latter without that of the earth. When a planet, as seen from the earth, is in the same direction as the sun, it is said to be in *conjunction* with the sun. This, however, in the case of an inferior planet, may be either when it passes between the sun and the earth or when it is on the farther side of the sun; the former is the *inferior* and the latter the *superior conjunction*. A superior planet can only be once in conjunction with the sun during its revolution, namely, when the sun is in a direct line between it and the earth. See SYZYGY and OPPOSITION.— 4. In *gram.* a connective indeclinable particle, serving to unite words, sentences, or clauses of a sentence, and indicating their relation to one another. There are two principal kinds of conjunctions — the conjunctive and the disjunctive; as, Peter *and* James, Robert *or* Ralph—*and* being called conjunctive, *or* disjunctive; but the latter is by no means a happy term. Connotation (kon-ō-tā'shon), *n.* That which constitutes the meaning of a word; the attributes expressed by a word. See extract.

The more usual mode of declaring the *connotation* of a name is by predicating two or more connotative names which make up among them the whole *connotation* of the name to be defined; as, Man is a corporeal, organized, animated, rational being, shaped so and so: or we may employ names which connote several of the attributes at once, as, Man is a rational animal shaped so and so. *J. There is a corresponding distinction between the derivates *connotation, connotative,* and *denotation, denotative.* Thus proper names have no *connotation* or are not *connotative,* but they are *denotative.* Thames is the name of a particular river, which is the *denotation* of that word, but as it is not given to the river in virtue of any attributes, that name is not *connotative.*

9. In *law,* the reason which moves a contracting party to enter into an agreement; the material cause of a contract; the price or motive of a stipulation. In all contracts each party gives something in exchange for what he receives. A contract is an agreement upon sufficient consideration. This consideration is express or implied; express, when the thing to be given or done is specified; implied, when no specific consideration is agreed upon, but justice requires it and the law implies it; as, when a man labours for another without stipulating for wages the law infers that he shall receive a reasonable *consideration.* A good consideration is that of blood or natural love; a valuable consideration is such as money, marriage, &c. Hence a consideration is an equivalent or recompense; that which is given as of equal estimated value with that which is received. In *Scots law,* when value in money or goods or services has been given in return for a deed granted, the consideration is said to be *onerous;* when a deed is granted without value, and from mere love and favour to the grantee, the consideration is termed *gratuitous.*—*In consideration of,* in respect or regard of; in return for.

Consonant (kon'sō-nant), *n.* A letter, so named because it is considered as being sounded only in connection with a vowel. But some consonants have no sound even when united with a vowel, and others have a very imperfect sound. The consonants are better called *articulations*, as they are the names given to the several closings or junctions of the organs of speech, which precede and follow the openings of the organs with which the vowels are uttered. These closings are either perfect, and wholly intercept the voice, as in the syllables *ek, ep, et;* or imperfect, and admitting some slight sound, as in *em, en.* Hence some articulations are called *mutes*, and others *semivowels* or *liquids.* The consonants begin or end syllables, and their use is to determine the manner of beginning or ending the vocal sounds. These closings or configurations of the organs being various, serve to diversify the syllables, as in uttering *ba, da, pa,* or *ab, ad, ap;* and although *b* and *p* may be considered as representing no sounds at all, yet they so modify the utterance of *ab, ap,* or *ba, pa,* that the slight difference between these articulations may be perceived as far as the human voice can be distinctly heard. [For distinction between *vowel* and *consonant* see extract under VOWEL.]

Consonants and their sounds are divided into *liquids*, *mutes*, and *sibilants*. The *liquids* are *r, l, m, n,* and the sound of *ng* in *sing*. They are so called because they flow on continuously, and are therefore more like vowels than consonants. The *mutes* are the larger number of the consonants. They are of various classes, according to the part of the mouth that utters them, and according to the concurrence of vocal sound from the throat. Those uttered by the mouth are *labials, p, f, b, v*. If we compare *p* and *f* with *b* and *v*, we find that in uttering the first two the air-tube is entirely closed and the voice shut off, as in *up, off;* while with the last two the stoppage is but partial, and we can still keep up a certain degree of sound, as in *cob, love*. This is the distinction between *sharp* and *flat* mutes. Those uttered by the teeth are *dentals:* (sharp) *t, th,* (flat) *d, dh* (*thine*). Those uttered by the throat are *gutturals:* (sharp) *k, ch* (Scotch *loch*), (flat) *g, gh* (Irish *lough*). The *sibilants* are the hissing sounds, *s, sh, z, zh*. There are two compounds of these, *tsh* (chest), *dzh* (jest). The letter *h*, a softened form of *ch* (*loch*), is called the aspirate. It will be seen from the above list that our alphabet is deficient in characters for expressing the consonant sounds *ng, sh, zh, th, dh*. It is farther redundant as regards the letters *c* (represented by *s* or *k*), *q* (for *kw*), and *x* (*ks* or *gz*). *Bain.*

Consonantal, Consonantic (kon-sō-nant'al, kon-sō-nant'ik), *a.* Relating to or partaking of the nature of a consonant.

Constable (kun'sta-bl), *n.* [O.Fr. and Pr. *conestable*, from L. *comes stabuli*, count of the stable.] 1. An officer of high rank in several of the medieval monarchies.—*The Lord High Constable of England* was anciently the seventh officer of the crown. He had the care of the common peace, in deeds of arms, and matters of war; being a judge of the court of chivalry, also called the court of honour. To this officer, and to the earl-marshal, belonged the cognizance of contracts, deeds of arms without the realm, and combats and blazonry within the realm. The power of this officer was so great, and so improperly used, that it was abridged by the 13th Richard II., and was afterwards forfeited in the person of Edward Stafford, duke of Buckingham, in 1521. It has never been granted to any person since that time, except *pro hac vice*, or on a particular occasion.—*Lord High Constable of Scotland.* The office of Lord High Constable of Scotland is one of great antiquity and dignity. He had anciently the command of the king's armies while in the field, in the absence of the king. He was likewise judge of all crimes or offences committed within 4 miles of the king's person, or within the same distance of the parliament or of the privy-council, or of any general convention of the states of the kingdom. The office is hereditary in the noble family of Errol, and is expressly reserved in the treaty of union.—*Constable of France.* The first officer of the kings of France, and till a later period the first military officer of the crown, who rose gradually till he became commander-in-chief of the army and the highest judge in all questions of chivalry and honour. This office was suppressed in 1627 on the death of the Constable Lesdiquieres. Napoleon re-established it in favour of the Prince of Wagram, but he had no successor.—*Constable of a castle* was the keeper or governor of a castle belonging to the king or a great noble. These offices were often hereditary; thus there were constables or hereditary keepers of the Tower, of Normandy, and of the castles of Windsor, Dover, &c.—2. An officer of the peace; a member of a police force; a policeman. This is now the usual meaning of the term, but up till recent times the word in England had also a restricted signification, being applied to officers of two kinds; viz. *constables of hundreds*, who were also called *high constables*; and *constables of vills* or *tithings*, who were called either *petty constables* or *tithing-men.* High constables were appointed either at quarter-sessions or by the justices of the hundred out of sessions; and petty constables were annually sworn into the office for each parish, upon presentment of the vestry. The duties of the high constable, respecting the preservation of the peace, were latterly merely nominal. *Chief constable*, as opposed to ordinary constable or policeman, is now the usual title of the head of the police of a county or borough. A constable has authority to arrest all persons who commit an affray, assault, or breach of the peace in his presence, and keep them in safe custody until they can be brought before a magistrate; and he is also authorized to execute such legal warrants as are committed to his hands by competent authorities. Two or more justices of the peace, upon information that disturbances exist or are apprehended, are authorized to appoint *special constables*; and in boroughs, the magistrates are authorized to swear in as many inhabitants as they think fit to act as special constables when called upon. A police force for the Metropolitan (London) district was established in 1829, and under various acts there are now bodies of county and borough police in the whole United Kingdom. In the United States, constables are town or city officers of the peace, with powers similar to those possessed by the constables in Great Britain. They are invested also with powers to execute civil as well as criminal processes, and to levy executions. In New England, they are elected by the inhabitants of towns in legal meeting.—*To outrun the constable*, (*a*) to escape from the subject in dispute when one's arguments are exhausted. *Hudibras.* (*b*) To live beyond one's means. A group of the fixed stars to which a definite name has been given. These names have mostly their origin in the mythology of the Greeks, derived and modified from the Egyptians and the East; and the stars forming each configuration are ranged and named in order of brilliancy by letters of the Greek alphabet being attached to them, *e.g.* we have α Ursæ Majoris, β Orionis, &c. The districts of the heavens thus mapped out and designated are entirely arbitrary, and in general correspond to no natural subdivision or grouping of the stars. Ursa Major, the Great Bear, in the northern, and Orion in the southern hemisphere, are the most important of the constellations, and, taken as starting-points, will enable a seaman easily to learn the position of any other group wanted. The constellations are divided into northern, southern, and zodiacal. Of the northern constellations there are, in the British catalogue, 34; of the southern, 45; and of the zodiacal, 12. Such quantities are also said to be in *continued proportion*, and a series of continued proportionals is otherwise called a *progression.*—*Continued base* or *bass*, in *music*, the figured base of a score continued through the whole piece. The term is only to be found in old music.—*Continued fractions*, in *arith.* a species of fractions which have acquired great value by their application to the solution of numerical equations and of problems in the indeterminate analysis. A continued fraction is one whose denominator is an integer with a fraction, which latter fraction has for its denominator an

integer with a fraction, and the same for this last fraction again, and so on to any extent. The reduction of common fractions and ratios that are expressed in large numbers to continued fractions, is no more than the common method of finding the greatest common measure of the two terms; for then the several quotients become the denominators of the fractions, the numerators being always 1 or unity. An approximation may thus be made to the value of a fraction whose numerator and denominator are in too high terms, and the farther the division is carried the nearer will the approximation be to the true value.

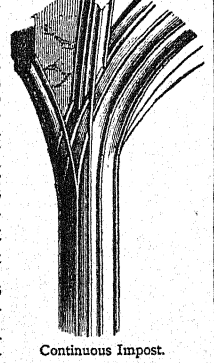
The chains of timber, or longitudinal sleepers, are secured to cross transoms fixed to piles. — *Continuous impost*, in *arch.* the mouldings of an arch continued along the pillar that supports it down to the ground without any member to mark the impost point, that is, the point at which the arch and pillar meet.



Continuous Impost.

2. In *bot.* not deviating from uniformity; the reverse of *articulated.* Thus a stem is said to be *continuous* which has no joints.—*Continuous, Incessant, Continual, Perpetual. Continuous* means unbroken, and is passive; *incessant*, meaning unceasing, is active. The former epithet is preferable to note duration, a condition, or simply a result; the latter to describe the exertions by which the condition or result is produced. We speak of a *continuous* fever, a *continuous* strain of music, the *continuous* murmur of a brook; but we say an *incessant* attack, the musicians played, or the brook murmured *incessantly.* 'I*ncessant* toil of six *continuous* days.' *Continual* does not imply unceasing continuity, but the habitual or repeated renewals of an act, state, &c.; as, a *continual* succession of storms. *Perpetual* is *continuous* with the idea of lastingness; as, *perpetual* motion.

The thought of our past years in me doth breed
Perpetual benediction. *Wordsworth.*

Perpetual is often used in the sense of *continual*, but is stronger, as implying that one sees no end to the series; as, I am sick of the *perpetual* bickerings of churchmen.

Continuously (kon-tin'ū-us-li), *adv.* In continuation; without interruption.—*Continuously, Continually.* The former denotes unbroken continuity, the latter close succession. When Croft's *Life of Dr. Young* was spoken of as a good imitation of Dr. Johnson's style, 'No, no,' said he (Burke), 'it is not a good imitation of Johnson; it has all his pomp, without his force; it has all the nodosities of the oak, without its strength; it has all the *contortions* of the sibyl, without the inspiration.' *Prior's Life of Burke.*

Contour (kon-tör'), *n.* [Fr. *contour*—*con*, and *tour*, a turn, revolution, turner's lathe, from L. *tornus*, Gr. *tornos*, a lathe. From L. *tornus* come also Fr. *tourner*, E. to *turn.*] The outline of a figure or body; the line that defines or bounds a body, its form being determined by the shape of the body; the periphery considered as distinct from the object: the word is scarcely used except when speaking of rounded or sinuous bodies; specifically, (*a*) in the *fine arts*, a line or lines representing the outline of any figure. (*b*) In *fort.* the horizontal outline of works of defence. When the conformation of the ground or works is described by contours or horizontal sections these sections are taken at some fixed vertical interval from each other suited to the scale of the drawing or the subject in hand; and the distances of the surface, at each interval, above or below some assumed plane of comparison, are given in figures at the most convenient places on the plan. (*c*) In *surv.* the outline of the surface of the ground with regard to its undulations.—*Contours*, or *contouring lines*, lines or levels carried along the surface of a country or district at a uniform height above the sea-level, and then laid down on a map or plan, so that an approximately true outline of its contour is presented, the degree of accuracy depending on the number of lines or levels taken between the sea-level and the highest point in the region. In the Ordnance Survey of Britain the lowest contouring line is at 50 feet above the sea-level, the next 100, the third 200, and so on at every additional 100 feet up to 1000, above which the levels are taken at every 250 feet. At and below 1000 feet the levels are taken by a theodolite or spirit-level; above that by a water-level. It is essential to the completeness of a contouring line that it should be carried on till it returns to the point whence it started, thus describing a sort of circle. The sea is a natural contouring line.

Contour (kon-tör'), *v.t.* To make a contour; to make an outline of a figure or of a country, in the latter case having reference only to its heights and depressions.

There are, strictly speaking, two such assemblies—one for the archiepiscopal province of Canterbury, the other for that of York, though the former is often spoken of as *the* Convocation, this province being by far the more important. In the province of Canterbury the Convocation consists of an upper and a lower house. In the upper house sit the archbishops and bishops; in the lower house the deans and archdeacons and the inferior clergy, represented by their proctors. In former times convocations had the power of enacting canons, but this power was virtually abolished by the statutes of Henry VIII., Elizabeth, and Charles II.; since that time the convocation has had no legislative business to transact and it had become customary to prorogue it every year immediately upon its assembling. Of late years, however, there has been a disposition to revive its deliberative functions, and to utilize these for the good of the church and of religion. Thus the propriety of revising the authorized translation of the Holy Scriptures and other cognate subjects have been discussed in its meetings.—4. *House of Convocation*, in the University of Oxford, is the assembly which enacts, amends, &c., laws and statutes; elects burgesses, many professors, and other officers, &c. To the former belongs the schaap-sticker of South Africa, a handsome, lively reptile about 2 feet long. Coroner (ko'rō-nėr), *n.* [L.L. *coronator*, from *corona*, a crown.] The title of an office established in Anglo-Saxon times, of which the holder was, as his name indicates, in a peculiar manner the officer of the crown, whose private rights of property, whether arising by escheat, wardship, or consisting in demesne, it was his business to maintain and superintend in the county for which he acted. The principal function which the coroner now exercises is that of holding inquests on the bodies of such as either die, or are supposed to die, a violent death. For this purpose he is to go to the place where any person is slain or has died suddenly, and by his warrant to the bailiffs or constables of the place summon a jury out of the neighbouring places or towns to make inquiry upon view of the body; and he and the jury are to inquire into the manner of killing, and all circumstances that occasioned the party's death; who were present, whether the dead person was known, where he lay the night before, &c., and to examine the body for signs of violence. He is also empowered to summon witnesses, and take their evidence in writing. When the jury have brought in their verdict the coroner is to return the inquisition to the next assizes or commission of jail delivery in the county, where the murderer or murderers may be proceeded against. The duty of a coroner is limited to a county or a division of a county. Most commonly there are three or four coroners in each county in England, but the number varies, there being in some six or seven. The council of every borough to which a separate court of quarter-sessions has been granted is empowered to appoint a coroner for the borough. By the act 7 and 8 Vict. xcii. coroners may be appointed for districts within counties, instead of the counties at large. Coroners of counties are elected for life, under the direction of stat. 28 Ed. III. vi., by the freeholders. There are no coroners in Scotland, but somewhat similar duties are performed by the procurators-fiscal.—The *coroner of the royal household* is an officer appointed to take inquisitions upon the bodies of all persons slain in the palace or in any house where the sovereign may happen to be. He has exclusive jurisdiction of the county coroner. See INQUEST, INQUISITION.

Such corporations are the mayor and aldermen of cities, the head and fellows of a college, the dean and chapter of a cathedral church, the stockholders of a bank or insurance company, &c. Lately, however, the necessities of trade have compelled the passing of several enactments, in virtue of which any body of persons united for the purposes of trade may acquire for themselves a corporate character. See JOINT-STOCK, LIMITED LIABILITY, MUNICIPAL.—*Corporation* and *Test Acts.* The Corporation Act, passed in the reign of Charles II., prevented any person from being regularly elected to any office belonging to the government of any city or corporation in England unless he had, within twelve months preceding, received the sacrament of the Lord's supper according to the rites of the Church of England. The Test Act, passed in the same reign, required all officers, civil and military, to take the oaths and make the declaration against transubstantiation, in the Court of King's Bench or Chancery, within six months after their admission; and also within the same time to receive the sacrament according to the usage of the Church of England in some public church. Iron thus treated will resist a much greater strain than flat iron, each groove representing a half tube. A single sheet, so thin as to be unable to stand without bending when placed vertically, will, after corrugation, sustain 700 lbs. without bending. Walls and roofs of temporary buildings, railway sheds and bridges, emigrants' houses, churches, sheds for dock-yards, &c., are now extensively made of iron thus treated. The chain is turned by steam, and the height of the axle is shifted from time to time, so that the empty buckets as they revolve, shall always strike the bottom of the canal at a fixed angle, scooping up mud, sand, and water. As each bucket reaches its highest point it discharges its contents into a long, open, iron pipe, which runs out at right angles to the barge. The further extremity of this pipe reaches beyond the bank of the canal, and, therefore, when the dredging is going on, there is a constant stream of liquid mud pouring from the pipe's mouth upon the shore, and thus raising the height of the embankment. The *covenant of works* is that implied in the commands, prohibitions, and promises of God; the promise of God to man, that man's perfect obedience should entitle him to happiness. 'This do, and live; that do, and die.' The *covenant of redemption* is the mutual agreement between the Father and Son respecting the redemption of sinners by Christ. The *covenant of grace* is that by which God engages to bestow salvation on man, upon the condition that man shall believe in Christ and yield obedience to the terms of the gospel.—4. *Eccles.* a solemn agreement between the members of a church, that they will act together in harmony with the precepts of the gospel. Specifically, in Scotland, the name given to the first bond or oath drawn up by the Scottish reformers, and signed in 1557, and to the similar document or Confession of Faith drawn up in 1581, in which all the errors of Popery were explicitly abjured. It was subscribed by James VI. and his council, and all his subjects were required to attach their subscription to it. It was again subscribed in 1590 and 1596. The subscription was renewed in 1638, and the subscribers engaged by oath to maintain religion in the same state as it was in 1580, and to reject all innovations introduced since that time. The oath, annexed to the Confession of Faith, received the name of the *Covenant.*—*Solemn League and Covenant,* a solemn contract entered into between the General Assembly of the Church of Scotland and commissioners from the English parliament in 1643, having for its object a uniformity of doctrine, worship, and discipline throughout Scotland, England, and Ireland, according to the word of God and the example of the best reformed churches.—*Covenant, Contract. Covenant,* as now used (apart from its legal meaning), carries with it the idea of solemnity, and is generally used of religious matters, no civil penalty necessarily following the infraction of it, while *contract* has a much wider sense as applied to some *agreement* between two or more. As law terms *covenant* is generally an agreement in writing, signed and sealed, whereas *contract* refers more especially to verbal agreements or such as are not signed and sealed.—Syn. Agreement, contract, compact, bargain, arrangement, stipulation.

This fluid or virus is capable of communicating genuine cow-pox to the human subject, and of conferring, in a great majority of instances, a complete and permanent security against small-pox. The discovery of this great boon to humanity, by which one of its greatest scourges may yet be extinguished, was due to Dr. Jenner's recognition of the fact that milkmaids, whose coarse hands had been inoculated by the vaccine virus, were exempt from small-pox. The shells used as currency occur principally in the Philippine Islands. They vary in value in different localities. In India 6000 to 7000 are equal to a rupee, while in Africa the value may be much higher, according to locality. The name is also given to other shells of the genus Cypræa.

It is generally obtained, however, from the products of the destructive distillation of wood. Creasote, in a pure state, is oily, heavy, colourless, refracting light powerfully, having a sweetish burning taste and a strong smell of peat smoke or smoked meat. It is so powerful an antiseptic that if meat be plunged into a solution of 1 per cent. of creasote, it does not putrefy. Wood treated with it is not subject to dry rot or other disease. It has been used in surgery and medicine with great success, and it is often an effectual cure for toothache arising from caries. When the merchant gives a credit he sells his wares on an expressed or implied promise that the purchaser will pay for them at a future time. The seller believes in the solvability and probity of the purchaser, and delivers his goods on that belief or trust; or he delivers them on the credit or reputation of the purchaser. The purchaser takes what is sold on credit. In like manner, money is lent on the credit of the borrower.

The term is also applied to the general credit of individuals in a nation; when merchants and others are wealthy and punctual in fulfilling engagements; or when they transact business with honour and fidelity; or when transfers of property are made with ease for ready payment. So we speak of the credit of a bank when general confidence is placed in its ability to redeem its notes; and the credit of a mercantile house rests on its supposed ability and probity, which induce men to trust to its engagements. Various methods of cremation have been proposed, the great difficulty being to consume the body without permitting the escape of noxious exhalations, and without mingling the ashes with foreign substances. With W. Cricket (krik'et), *n.* [O.Fr. *criquet*, a stick used in a ball game.] An open-air game played with bats, balls, and wickets, long peculiar to England, but now popular throughout the British Empire and in the United States. It is played generally by two opposite sets or sides of players, generally numbering eleven players each. Two wickets of three stumps each are pitched fronting each other at a distance of about 22 yards apart. On the top of each set of stumps are placed two small pieces of wood called bails. After the rival sides have tossed for the choice of either taking the bat or fielding, two men are sent to the wickets bat in hand. The opposite or fielding side are all simultaneously engaged; one (the bowler) being stationed behind one wicket for the purpose of bowling his ball against the opposite wicket, where his coadjutor (the wicket-keeper) stands ready to catch the ball should it pass near him; the other fielders are placed in such parts of the field as is judged most favourable for stopping the ball after it has been struck by the batsman or missed by the wicket-keeper. It is the object of the batsman to prevent the ball delivered by the bowler reaching his wicket either by merely stopping it with his bat or by driving it away to a distant part of the field. Should the ball be driven any distance the two batsmen run across and exchange wickets, and continue to do so as long as there is no risk in being 'run out,' that is, of having the stumps struck by the ball while they are out of their position near the wickets. Each time the batsmen run between the wickets is counted as a 'run,' and is marked to the credit of the striker of the ball. If the batsman allows the ball to carry away a bail or a stump, if he knocks down any part of his own wicket, if any part of his person stops a ball that would have otherwise reached his wicket, or if he strikes a ball so that it is caught by one of the opposite party before it reaches the ground, he is 'out,' that is, he gives up his bat to one of his own side, and so the game goes on until all the men have played and been put out. This constitutes what is called an 'innings.' The off-side now become the on-side and try to defend their wickets and make runs as their rivals did. Generally after two innings each have been played by the contestants the game comes to an end, that side being the victors who can score the greatest number of runs. A rude form of the game is known to have been played in the fourteenth century; in 1817 it had so developed that very little alteration has been since introduced.

All men are *sinful*, but all men are not *criminal.* *Wicked* is far stronger than *sinful*, and designs one who sins wilfully and designedly. It refers both to persons and acts, as well as to thoughts tending to result in acts. A *wicked* man commits mischief, because he takes pleasure in doing ill, as in injuring his neighbour. An *immoral* man, on the contrary, may be the slave of his passions or depraved cravings, and yet have generous sentiments and aspirations after reformation. *Depraved* implies a fall from a better state, and involves not only actual wickedness, but complete moral corruption. In some—the sandhopper, woodlouse, &c.—the head is partially distinct from the thorax. The Crustacea breathe by branchiæ or gills, or by membranous vesicles, or by the general surface; and the body is composed of a series of rings more or less distinct. They possess the faculty of reproducing lost parts in an eminent degree. They have a tegumentary or outward, calcareous skeleton, in nature obviously different from the internal one of the vertebrata; it consists of a great number of distinct pieces connected together by portions of the epidermic envelope, just as among the higher animals certain bones are connected together by cartilages. Several species, if not all, moult or cast these outer skeletons or shells in the progress of growth; this is the case with crabs, crayfish, &c. They are divided into sections, the Podophthalmata or stalked-eyed, the Edriophthalmata or sessile-eyed, the Cirripedia, Copepoda, Ostracoda, Phyllopoda, Xiphosura.

Crystallization (kris'tal-iz-ā"shon), *n.* 1. The act or process by which the parts of a solid body, separated by the intervention of a fluid or by fusion, again coalesce or unite, and form a solid body. If the process is slow and undisturbed, the particles assume a regular arrangement, each substance taking a determinate and regular form, according to its natural laws; but if the process is rapid or disturbed, the substance takes an irregular form. This process is the effect of refrigeration or evaporation.—2. The mass or body formed by the process of crystallizing.—*Alternate crystallization*, a species of crystallization which takes place when several crystallizable substances, which have little affinity for each other, are present in the same solution. The substance which is largest in quantity, and least soluble, crystallizes first, in part; the least soluble substance next in quantity then begins to crystallize; and thus different substances, as salts, are often deposited in successive layers from the same solution.—*Water of crystallization.* See under WATER.

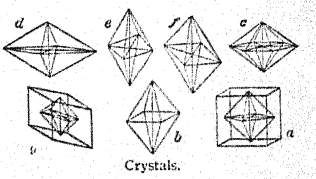
The doctrine or science of crystallization, teaching the principles of the process, and the forms and structure of crystals. The form of any solid may be determined by referring it to three rectilineal axes, intersecting one another in a single point. In some systems of crystallography, however, it is found more convenient to refer the forms of the crystals to four axes. The following are the generally adopted systems:—



Crystals.

(*a*) *Monometric*, three rectangular axes all of equal length. (*b*) *Dimetric*, three rectangular axes, two of equal, the third of different length. (*c*) *Hexagonal*, four axes, three of equal length, in the same plane, and inclined to each other at an angle of 60°; the fourth of different length, and at right angles to the plane of the other three. (*d*) *Trimetric* or *rhombic*, three retangular axes of unequal lengths. (*e*) *Monoclinic*, three axes, two at right angles to each other, the third perpendicular to one and oblique to the other. (*f*) *Diclinic*, three axes, two at right angles, the third oblique to both. (*g*) *Triclinic*, three axes, all oblique to each other. The study of crystallography is of great importance to the chemist and mineralogist, as the nature of many substances may be ascertained from an inspection of the forms of their crystals.—2. It belongs to the zygodactylous or yoke-footed tribe of birds, or those which have the toes situated two before and two behind, so that the feet are adapted rather for grasping branches than for climbing. The true cuckoos, to which the typical appellation Cuculus is now restricted, are mostly confined to the warmer regions of the globe, chiefly India and Africa, though some are summer

visitants of the colder climates. The common European cuckoo (*Cuculus canorus*) is a bird about the size of a small pigeon, or rather appearing of that size, from the great abundance of its plumage. The well-known vernal call-note of this species is generally first heard, in the south of England, about the middle of April. This bird, like the cow-bunting, deposits its eggs in the nest of some other species, generally in that of the hedge-sparrow, meadow-pipit, or pied water-wagtail. The young cuckoo ejects from the
